Project Overview

This test plan defines the strategy and scope for the manual functional testing of the OpenCart e-commerce platform. The primary goal is to ensure that the fundamental user entry points and navigation elements are stable, secure, and perform according to requirements.

Test Scope

The testing activities will focus exclusively on the following three core modules:

- Registration Functionality: Verifying the end-to-end process of creating a new customer account, including field validation (required fields, email formats) and successful database entry.
- Login&Logout Functionality: Validating secure access for existing users, covering positive scenarios (valid credentials) and negative scenarios (invalid passwords, non-existent accounts). Ensuring that user sessions are terminated correctly and that private account information is no longer accessible after exiting the system.
- Home Page: Evaluating the integrity of the landing page, including the visibility of the navigation menu, search bar functionality, and the correct loading of featured products or banners.

Test Environment

- Windows 11 - Chrome and Edge
- iPhone Mobile OS - Safari

Exclusions

- Features that are not mentioned in the scope section
- Third-party features and payment functionalities
- Automation test

Test Strategy

OpenCart has demanded Zhicheng Huang to perform functional testing of all areas mentioned in the above scope section. It is important to make sure the most fundamental functions are working before continuing on next steps.

I will perform the following steps to make sure the test procedure is without any flaws:

Step #1 - Prepare Test Scenarios and Test Cases documents for different features in the Scope section. I will use the following techniques to help me test the functionalities:

- Equivalence Partitioning: Test inputs in different groups.
- Boundary Value Analysis: Test inputs outside of the required boundaries.
- State Transition Testing: Test correctness of system states based on user actions.
- Decision Table Testing: Test login function with username and password combinations.
- Error Guessing: Test unexpected user inputs and actions.
- Happy Path Testing: Test perfect inputs.
- Negative Testing: Test bad inputs or actions.

Step #2 - The testing approach for the application:

- Use smoke testing to check the basic functions of the application.
- Reject the current build if it did not pass the smoke test and wait for the stable build.
- Once the build passes the smoke test, we perform the test in the test cases document.
- Test the application in multiple environments simultaneously.
- Following tests will be performed throughout the cycle until the product is desirable:
 - Smoke testing and Sanity testing
 - Regression testing and retesting
 - Usability testing and functionality/UI testing
- Shift left testing will be performed to increase the test efficiency during development.

Defect Reporting Procedure:

During the testing cycle:

- Defects and bugs will be retested to ensure the reproducibility and related evidence will be gathered and documented.
- Any odd behavior will be documented as an observation or risk.
- The document will be sent to Dev or management at the end of each day.

Roles and Responsibilities

Name	Role	Responsibility
Aaron A.	Test manager	• Management and coordination • Quality oversight
Bob B.	Test lead	• Create Test Plan and get client signoffs • Interact with application with tests • Report defects • Verify legitimacy of defects and their reproducibility • Submit documents to client
Charlie C.	Senior test engineer	• Create test cases • Interact with application with tests • Report defects
Zhicheng Huang	Junior test engineer	• Interact with application with tests • Report defects

Test Schedule

Task	Timeline
Create test plan	May 4 - May 8
Create test case	May 11 - May 15
Execute test case	May 18 - June 12
Submit report documents	June 15 - June 19

Pricing

N/A

Entry and Exit Criteria

Following provides the entry and exit criteria for different phases of software testing life cycle (STLC):

Requirement Analysis

Entry Criteria: Functional Requirement Specifications (FRS) document received.

Exit Criteria: Requirements are understood by the test team and doubts are cleared.

Test Planning

Entry Criteria: Understand the FRS document.

Exit Criteria: Test plan document is signed off by the client.

Test Design

Entry Criteria: Test plan document is signed off by the client.

Exit Criteria: Test scenarios and test cases documents are signed off by the client.

Test Execution

Entry Criteria: Application is ready to test.

Exit Criteria: Test and defect reports are ready.

Test Closure

Entry Criteria: Test and defect reports are ready.

Exit Criteria: Test summary document submitted.

Approvals

Documents that need client approval:

- Test plan
- Test Scenario and Test case
- Defect report

The testing cycle will continue only when we get proper approvals.
